

Method for fitting, searching and ordering clothes remotely

PCT App # 050007

Method for fitting, searching and ordering clothes remotely

A method of remotely fitting, selecting and/or ordering clothing based on user-generated data is provided, that comprises: providing a user's digital terminal with an application and providing at least one server with a database, that are connected to the user's digital terminal via a telecommunications line; generating individual data of the user related to his/her body features/sizes via the said application in the user's digital terminal; processing the data of the two- or three-dimensional model of the clothes presented for sale in the database via the said server and storing them in the database for the purpose of virtual fitting of the clothes by the user; sending the data of the two- or three-dimensional model of the clothes presented for sale in the database to the user's digital terminal via the telecommunication line; comparing the data of the two- or three-dimensional model of the garment that is received by the user's digital terminal via the said application with the said individual data of the user; wherein the generation of said individual data of the user is carried out in predetermined sections of the user's body according to the proportional ratios of the body dimensions and taking into account the peculiarities of the user's body shape, and the server processes the data of the two- or three-dimensional model of the said clothes according to the proportional ratios of the user's body dimensions.

The company has been applied for PCT patenting (PCT/GE2022/050007)

The screenshot shows a Walmart product page for a long-sleeve t-shirt. The page features a size adjustment tool with a table of measurements and two buttons: 'SEARCH' and 'ORDER'. The table has columns for 'Your Size (Sm)', 'Gap', and 'Your Desired Size'. The 'SEARCH' button is labeled '31' and the 'ORDER' button is labeled '32'. A line labeled '30' points to the table area.

	Your Size (Sm)	Gap	Your Desired Size
Shoulder	42.6	-4	-2
Chest	104	-2.5	0
Waist	84	+4.5	-1
Hips	110	0	+2
Length	140	102	85
Dilatation (k)	7.62	LOA	

To search, desired size, press Search Button

Positive aspects of the Invention

1. Only this method allows wherein the user's digital terminal application is configured with the capability of modeling the generated size data with user-desired assumptions that differ from the user's avatar;
2. This method differs from all possible versions in that the data of the items of clothing put up for sale are compared with the personal data of the buyer only in the application and are not transmitted to remote servers;
3. This method differs from all others in that it functions on the basis of the law of proportional dependence determined by the introduced coefficient of the ratio of the dimensions of the natural and from the dimensions of the customer's body and garments, allowing the generation of all unspecified sizes in any zone or conditional section of the body in relation to the natural sizes of objects;
4. Makes it possible to format comparative representation information in length units with the possibility of generating them in each conditional area of the section of the customer's body and garment or a given size of the conditional model;

5. Virtual fitting of garments takes place, with the ability to see the product in all areas and conditional sections of the body \pm i.e. more, equal or less by the value of the length obtained by calculation, by the introduced ratio of dimensions (free space, fit on the body, compression of the body, taking into account the property and coefficient of stretching of the material of the product, with a special desire of the buyer to allow or no longer allow such stretching with a warning only for strength limits of product materials);
6. This method allows a virtual fitting or custom order download to manufacturers of any brand and model without disclosing personal data;
